

Claims

- [c1] 1.– Improved plug tap terminal for side insertion terminal, constituted of a cable terminal structure constituted of a holding base (1) from which a connection plug (2) and a cable guiding small channel (3) protrude from each one of its two ends, characterized in that said holding base (1) is formed by a prismatic structure provided with side windows (4) and horizontal windows (5) for holding by means of flaps that have been foreseen in the fixing mechanism in the connector, susceptible to withstanding the forces in both directions that are transversal to the longitudinal axis of the terminal.
- [c2] 2.– Improved plug tap terminal for side insertion terminal according to claim 1, characterized in that the shape of the connection plug (2) of said terminal also adopts a prismatic profile with straight walls that are parallel to the longitudinal axis.
- [c3] 3.– Improved plug tap terminal for side insertion terminal according to any of the previous claims, characterized in that said small channel (3) is constituted of one or several curve steps joined together for channeling the cable towards said horizontal window (5) through which

it enters to the inside of said terminal holding base (1), inside of which the electric connection with the plug (2) or connection element occurs.
